

+5V Powered RS-232 Transmitters/Receivers with 0.1Microfarad External Capacitors

The HIN202, HIN206, HIN207, HIN208, HIN211, HIN213 family of RS-232 transmitters/receivers interface circuits meet all EIA RS-232E and V.28 specifications, and are particularly suited for those applications where $\pm 12V$ is not available. They require a single +5V power supply and feature onboard charge pump voltage converters which generate +10V and -10V supplies from the 5V supply. The family of devices offers a wide variety of RS-232 transmitter/receiver combinations to accommodate various applications (see Selection Table).

The HIN206, HIN211 and HIN213 feature a low power shutdown mode to conserve energy in battery powered applications. In addition, the HIN213 provides two active receivers in shutdown mode allowing for easy "wake-up" capability.

The drivers feature true TTL/CMOS input compatibility, slew rate-limited output, and 300 Ω power-off source impedance. The receivers can handle up to $\pm 30V$ input, and have a 3k Ω to 7k Ω input impedance. The receivers also feature hysteresis to greatly improve noise rejection.

Applications

- Any System Requiring RS-232 Communications Port
 - Computer - Portable, Mainframe, Laptop
 - Peripheral - Printers and Terminals
 - Instrumentation
 - Modems

Selection Table

PART NUMBER	POWER SUPPLY VOLTAGE	NUMBER OF RS-232 DRIVERS	NUMBER OF RS-232 RECEIVERS	NUMBER OF 0.1μF EXTERNAL CAPACITORS	LOW POWER SHUTDOWN/TTL THREE-STATE	NUMBER OF RECEIVERS ACTIVE IN SHUTDOWN
HIN202	+5V	2	2	4 Capacitors	No/No	0
HIN206	+5V	4	3	4 Capacitors	Yes/Yes	0
HIN207	+5V	5	3	4 Capacitors	No/No	0
HIN208	5V	4	4	4 Capacitors	No/No	0
HIN211	+5V	4	5	4 Capacitors	Yes/Yes	0
HIN213	+5V	4	5	4 Capacitors	Yes/Yes	2

Features

- Meets All RS-232E and V.28 Specifications
- Requires Only 0.1 μ F or Greater External Capacitors
- High Data Rate. 120kbit/s
- Two Receivers Active in Shutdown Mode (HIN213)
- Requires Only Single +5V Power Supply
- Onboard Voltage Doubler/Inverter
- Low Power Consumption (Typ) 5mA
- Low Power Shutdown Function (Typ) 1 μ A
- Three-State TTL/CMOS Receiver Outputs
- Multiple Drivers
 - $\pm 10V$ Output Swing for +5V Input
 - 300 Ω Power-Off Source Impedance
 - Output Current Limiting
 - TTL/CMOS Compatible
 - 30V/ μ s Maximum Slew Rate
- Multiple Receivers
 - $\pm 30V$ Input Voltage Range
 - 3k Ω to 7k Ω Input Impedance
 - 0.5V Hysteresis to Improve Noise Rejection

Pin Descriptions

PIN	FUNCTION
V _{CC}	Power Supply Input 5V ±10%, (5V ±5% HIN207).
V+	Internally generated positive supply (+10V nominal).
V-	Internally generated negative supply (-10V nominal).
GND	Ground Lead. Connect to 0V.
C1+	External capacitor (+ terminal) is connected to this lead.
C1-	External capacitor (- terminal) is connected to this lead.
C2+	External capacitor (+ terminal) is connected to this lead.
C2-	External capacitor (- terminal) is connected to this lead.
T _{IN}	Transmitter Inputs. These leads accept TTL/CMOS levels. An internal 400kΩ pull-up resistor to V _{CC} is connected to each lead.
T _{OUT}	Transmitter Outputs. These are RS-232 levels (nominally ±10V).
R _{IN}	Receiver Inputs. These inputs accept RS-232 input levels. An internal 5kΩ pull-down resistor to GND is connected to each input.
R _{OUT}	Receiver Outputs. These are TTL/CMOS levels.
\overline{EN} , EN	Receiver enable Input. With $\overline{EN} = 5V$ (HIN213 EN = 0V), the receiver outputs are placed in a high impedance state.
SD, \overline{SD}	Shutdown Input. With SD = 5V (HIN213 $\overline{SD} = 0V$), the charge pump is disabled, the receiver outputs are in a high impedance state (except R4 and R5 of HIN213) and the transmitters are shut off.
NC	No Connect. No connections are made to these leads.

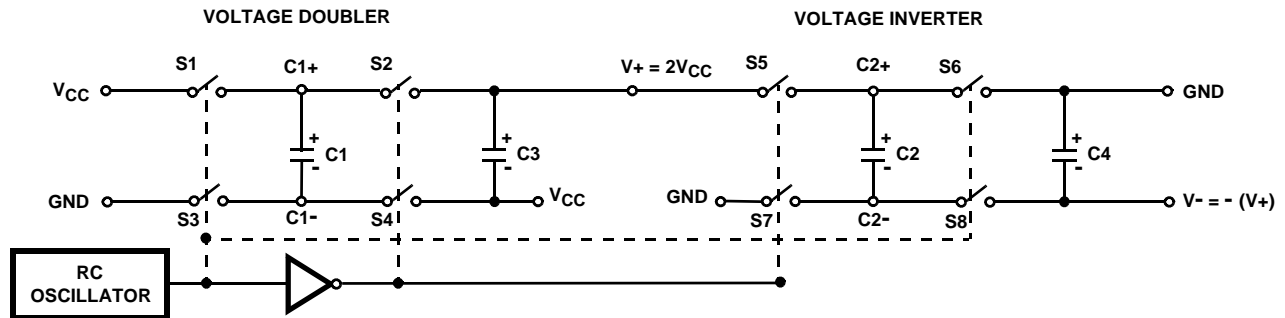

FIGURE 1. CHARGE PUMP

Detailed Description

The HIN202, HIN206, HIN207, HIN208, HIN211, HIN213 family of RS-232 transmitters/receivers are powered by a single +5V power supply feature low power consumption, and meet all EIA RS232C and V.28 specifications. The circuit is divided into three sections: The charge pump, transmitter, and receiver.

Charge Pump

An equivalent circuit of the charge pump is illustrated in Figure 1. The charge pump contains two sections: the voltage doubler and the voltage inverter. Each section is driven by a two phase, internally generated clock to generate +10V and -10V. The nominal clock frequency is 125kHz. During phase one of the clock, capacitor C1 is charged to V_{CC} . During phase two, the voltage on C1 is added to V_{CC} , producing a signal across C3 equal to twice V_{CC} . During phase two, C2 is also charged to $2V_{CC}$, and then during phase one, it is inverted with respect to ground to produce a signal across C4 equal to $-2V_{CC}$. The charge pump accepts input voltages up to 5.5V. The output impedance of the voltage doubler section (V+) is approximately 200Ω , and the output impedance of the voltage inverter section (V-) is approximately 450Ω . A typical application uses $0.1\mu\text{F}$ capacitors for C1-C4, however, the value is not critical. Increasing the values of C1 and C2 will lower the output impedance of the voltage doubler and inverter, increasing the values of the reservoir capacitors, C3 and C4, lowers the ripple on the V+ and V- supplies.

During shutdown mode (HIN206 and HIN211, $\overline{SD} = V_{CC}$, HIN213, $\overline{SD} = 0\text{V}$) the charge pump is turned off, V+ is pulled down to V_{CC} , V- is pulled up to GND, and the supply current is reduced to less than $10\mu\text{A}$. The transmitter outputs are disabled and the receiver outputs (except for HIN213, R4 and R5) are placed in the high impedance state.

Transmitters

The transmitters are TTL/CMOS compatible inverters which translate the inputs to RS-232 outputs. The input logic threshold is about 26% of V_{CC} , or 1.3V for $V_{CC} = 5\text{V}$. A logic 1 at the input results in a voltage of between -5V and V- at the output, and a logic 0 results in a voltage between +5V and (V+ - 0.6V). Each transmitter input has an internal $400\text{k}\Omega$ pullup resistor so any unused input can be left unconnected and its output remains in its low state. The output voltage swing meets the RS-232C specifications of $\pm 5\text{V}$ minimum with the worst case conditions of: all transmitters driving $3\text{k}\Omega$ minimum load impedance, $V_{CC} = 4.5\text{V}$, and maximum allowable operating temperature. The transmitters have an internally limited output slew rate which is less than $30\text{V}/\mu\text{s}$. The outputs are short circuit protected and can be shorted to ground indefinitely. The powered down output impedance is a minimum of 300Ω with $\pm 2\text{V}$ applied to the outputs and $V_{CC} = 0\text{V}$.

Receivers

The receiver inputs accept up to $\pm 30\text{V}$ while presenting the required $3\text{k}\Omega$ to $7\text{k}\Omega$ input impedance even if the power is off ($V_{CC} = 0\text{V}$). The receivers have a typical input threshold of 1.3V which is within the $\pm 3\text{V}$ limits, known as the transition region, of the RS-232 specifications. The receiver output is 0V to V_{CC} . The output will be low whenever the input is greater than 2.4V and high whenever the input is floating or driven between +0.8V and -30V. The receivers feature 0.5V hysteresis (except during shutdown) to improve noise rejection. The receiver Enable line (\overline{EN} on HIN206 and HIN211, EN on HIN213) when unasserted, disables the receiver outputs, placing them in the high impedance mode. The receiver outputs are also placed in the high impedance state when in shutdown mode (except HIN213 R4 and R5).

FIGURE 2. TRANSMITTER

FIGURE 3. RECEIVER

$$\text{AVERAGE PROPAGATION DELAY} = \frac{t_{PHL} + t_{PLH}}{2}$$

FIGURE 4. PROPAGATION DELAY DEFINITION

HIN213 Operation in Shutdown

The HIN213 features two receivers, R4 and R5, which remain active in shutdown mode. During normal operation the receivers propagation delay is typically $0.5\mu\text{s}$. This propagation delay may increase slightly during shutdown. When entering shut down mode, receivers R4 and R5 are not valid for $80\mu\text{s}$ after $\overline{SD} = V_{IL}$. When exiting shutdown mode, all receiver outputs will be invalid until the charge pump circuitry reaches normal operating voltage. This is typically less than 2ms when using $0.1\mu\text{F}$ capacitors.

Test Circuits (HIN202)

FIGURE 7. GENERAL TEST CIRCUIT

FIGURE 8. POWER-OFF SOURCE RESISTANCE CONFIGURATION

Application Information

The HIN2XX may be used for all RS-232 data terminal and communication links. It is particularly useful in applications where $\pm 12V$ power supplies are not available for conventional RS-232 interface circuits. The applications presented represent typical interface configurations.

A simple duplex RS-232 port with CTS/RTS handshaking is illustrated in Figure 9. Fixed output signals such as DTR (data terminal ready) and DSRS (data signaling rate select) is generated by driving them through a $5k\Omega$ resistor connected to V+.

In applications requiring four RS-232 inputs and outputs (Figure 10), note that each circuit requires two charge pump capacitors (C1 and C2) but can share common reservoir capacitors (C3 and C4). The benefit of sharing common reservoir capacitors is the elimination of two capacitors and the reduction of the charge pump source impedance which effectively increases the output swing of the transmitters.

NOTES:

- Controlling Dimensions: INCH. In case of conflict between English and Metric dimensions, the inch dimensions control.
- Dimensioning and tolerancing per ANSI Y14.5M-1982.
- Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication No. 95.
- Dimensions A, A1 and L are measured with the package seated in JEDEC seating plane gauge GS-3.
- D, D1, and E1 dimensions do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.010 inch (0.25mm).
- E and e_A are measured with the leads constrained to be perpendicular to datum $-C-$.
- e_B and e_C are measured at the lead tips with the leads unconstrained. e_C must be zero or greater.
- B1 maximum dimensions do not include dambar protrusions. Dambar protrusions shall not exceed 0.010 inch (0.25mm).
- N is the maximum number of terminal positions.
- Corner leads (1, N, N/2 and N/2 + 1) for E8.3, E16.3, E18.3, E28.3, E42.6 will have a B1 dimension of 0.030 - 0.045 inch (0.76 - 1.14mm).

NOTES:

1. Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication Number 95.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15mm (0.006 inch) per side.
4. Dimension "E" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.25mm (0.010 inch) per side.
5. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
6. "L" is the length of terminal for soldering to a substrate.
7. "N" is the number of terminal positions.
8. Terminal numbers are shown for reference only.
9. The lead width "B", as measured 0.36mm (0.014 inch) or greater above the seating plane, shall not exceed a maximum value of 0.61mm (0.024 inch)
10. Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact.

NOTES:

1. Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication Number 95.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.20mm (0.0078 inch) per side.
4. Dimension "E" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.20mm (0.0078 inch) per side.
5. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
6. "L" is the length of terminal for soldering to a substrate.
7. "N" is the number of terminal positions.
8. Terminal numbers are shown for reference only.
9. Dimension "B" does not include dambar protrusion. Allowable dambar protrusion shall be 0.13mm (0.005 inch) total in excess of "B" dimension at maximum material condition.
10. Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact.
